Brief product description:
A range of IP rated accessories designed to protect the potentially dangerous electricity supply in the most arduous of conditions.

Features:
- Clearly marked terminals with backed out captive screws for easy installation
- 20 Amp, 20AX inductive rated
- Covers to seal the fixing screws
- Earth terminal in mounting box
- All cable entries in the 4 sides have removable blanking caps.
- Housing will accept alternative switch modules from the Grid range
- Neon indicator that can be wired to illuminate when off or on depending on wiring blanking caps.

20 Amp 20 AX Switches

Installation Information

Safety Warning
Before use please read carefully and use in accordance with these safety wiring instructions.

Before commencing any electrical work ensure the supply is switched off at the mains. Either by switching off the consumer unit or by removing the appropriate fuse. Wiring should be in accordance with the latest edition of the IEE regulations (BS 7671).

Wire Identification – Twin & Earth Cable
- EARTH = Green/Yellow sleeving
- NEUTRAL = Black (pre Apr 04) / Blue (after Apr 04)
- LIVE = Red (pre Apr 04) / Brown (after Apr 04)

The ends of the individual conductors should have the insulation removed by approx. 12mm. Any bare earth conductors should be sleeved to within 12mm of the ends.

(These details are for general information only and conductor lengths may need to be trimmed in certain installations).

Product Application & Features
The Weatherproof Switch range comprises a robust polycarbonate enclosure incorporating a 1 or 2 Gang Grid Switch Module arrangement. It provides a convenient & safe wall mounted control for outdoor equipment such as lighting, garden pond pumps, etc up to 20A current rating. Modules can be changed for others from the Grid range such as a 20A Double Pole or Retractive LPA50 switch.

The enclosure is IP66 rated in use, which means that the sealed construction provides a very high level of protection against the ingress of both water & dust.

The Neon indicator can be used to illuminate the switch in a number of ways depending on wiring, & presence of supply/Neutral.

Wire Identification – Twin & Earth Cable
- EARTH = Green/Yellow sleeving
- NEUTRAL = Black (pre April 04) / Blue (after April 04)
- LIVE = Red (pre April 04) / Brown (after April 04)

The ends of the individual conductors should have the insulation removed by approx. 12mm. Any bare earth conductors should be sleeved to within 12mm of the ends.

(These details are for general information only and conductor lengths may need to be trimmed in certain installations).

Safety Instructions – Important
Please Read ‘Changes To Building Regulations’
1. An outdoor location should be chosen ensuring adequate access to a mains supply circuit. The circuit MUST be protected by an appropriate fuse, circuit breaker or RCD (Residual Current Device) in accordance with current IEE wiring regulations.
2. Where conduit is used for cable runs, water condensation MUST be prevented from collecting inside the unit & conduit. Drain holes MUST be drilled out (see Installation Instructions)
3. If metal conduit is used, earth continuity across the conduit must be maintained using appropriate connections (not supplied). An earth terminal in the Rear Box is provided as required.
4. Where outdoor cable runs occur, ensure cable recommended for outdoor installations is used. In general, rubber insulated cable & plastic M20 cable glands can be used. Alternatively standard flat PVC twin & earth mains cable inside 20mm plastic or metal conduit may be used. Where necessary, SWA (Steel Wire Armoured) cable with metal cable glands should be used.
5. The outdoor use of unprotected flat PVC insulated cable is NOT recommended.
6. To ensure continued safe & proper weatherproof operation, unused cable entries MUST have Blank Plugs fitted.

Installation Instructions

Ensure Safety Instructions Have Been Read First
The Rear Box has multiple cable entry positions on sides & one rear knockout cable entry. One side has 2 cable entry positions. Four drain hole positions are provided in relation to conduit positions as shown. Note position of earth terminal.

1. The unit should be mounted on a clean, rigid vertical surface suitable to accept screw type fixings. Surface should be reasonably flat as unevenness could cause product damage or affect operation.
2. Undo fixing screws & remove Front Assembly from Rear Box.
3. For cable entry, decide if conduit is being used & entry positions. For side, top or rear entry the lowestmost drain hole position MUST be drilled out using a 5mm drill. ONLY ONE drain hole position must be drilled.
4. Mount the Rear Box using No.8 screws in all four, or at least two diagonal positions on fixing centres shown. The fixing holes are slotted to enable some rotation adjustment if required. Fit supplied Bungs over all used fixing screw positions to seal aperture recesses.
5. Make cable entry into Rear Box as required. Only remove Blank Plugs for positions used. Ensure adequate excess lengths of cable for connection to socket. Install & seal all cable glands & conduit to manufacturer’s instructions. Ensure the Gasket Seal is properly fitted over front edge of Rear Box.
6. Offer up Front Assembly to Rear Box to determine final lengths of cables & cut to suit. Strip outer insulation as required & then trim insulation on individual wires & 10mm to expose conductor ends.
7. Each standard Switch Module is a 2-way, single pole type & has 3 clearly marked terminals: - COM, 2 WAY & 1 WAY as shown.
8. For ONE WAY Switching, wire the module as follows:-
   Connect LIVE wire to COM terminal
   Connect SWITCHED LIVE wire to 1 WAY terminal...
Installation Information

7b) For TWO WAY Switching using this Switch & another remote switch, wire the module as follows:-

On one switch:-

Connect LIVE wire to COM terminal

Connect SWITCHED LIVE wire to 1 WAY/L1 terminal

Connect wire core 1 between COM terminals

Connect wire core 2 between 1 WAY/L1 terminals

Connect wire core 3 between 2 WAY/L2 terminals

Note: the colours of the wires will be dependent on the type of cable used. See Wire Identification section for reference.

If a supplied Module has been changed for another compatible Switch Module type from the Grid range, the appropriate wiring instructions for the changed Module must be followed.

8. The unit has Neon Indicator pre-wired between the COM terminal & terminal block, with a Link wire to 1 WAY terminal. The Neon can be wired in one of three ways depending on presence of Neutral supply.

1. Power Mode: Neon ALWAYS ON when POWER is ON.
2. Switch Mode: Neon ONLY ON when switch is ON.
3. Locator Mode: Neon ONLY ON when switch is OFF.

All other connections should be as section 7.

Note – 2 Gang switch ONLY

For Locator & Switch Modes the Neon can ONLY be wired to work with one switch, it CAN NOT function with both switches.

9. Ensure all terminal screws are tight & all wires are neatly routed & not unduly stretched or pinched.

10. Any earth connections MUST be made & continuity maintained.

11. Where any earth conductor is a bare wire, it MUST be sleeved with green/Yellow sleeving.

12. After wiring Switch, refit Front Support onto Rear Box using fixing screws – DO NOT OVERTIGHTEN. Ensure the Gasket Seal is properly fitted over front edge of Rear Box before tightening screws.

13. Fix Screw Covers to complete installation.

14. Switch power back on & check Switch is working. The product is now ready to use.

All changes to building regulations – Important!

As from 1 January 2005, any electrical work done in domestic, fixed wiring installations in England and Wales, will have to follow new rules & changes to the Building Regulations Part P. These rules have been introduced to help reduce the number of deaths, injuries and fires caused by faulty installations.

The installation work may be carried out by anyone providing it is in accordance with the Regulation standards.

Certain electrical work (notifiable or minor work) may be carried out without having to use a registered electrician or notify Local Authority Building Control, such as:

• replacing any electrical fitting (for example, socket outlets, light fittings, control switches)
• adding fused spurs, sockets or lights to an existing circuit (but not in a kitchen, bathroom or outdoors)
• any repair or maintenance work

For minor work done by a non-qualified electrician, it is highly recommended it is checked by a qualified electrician to ensure it is safe.

For all other work (notifiable or major work) a Building Regulations application is required & it must be checked to make sure it is safe.

This may be done by either an electrician who is part of a competent person self-certification scheme, or by notifying the Local Authority Building Control Department who will make required arrangements.

An application must be made to the Local Authority before commencing work such as:

• adding a new circuit
• adding/altering any circuit in a room with water (kitchen, bathroom, etc)
• adding/altering any circuit outdoors (outdoor sockets, lights, etc)

Where work is done by a qualified electrician, they will be responsible for checking the work. Local Authority does not need notification.

Where a qualified electrician or Local Authority is responsible for checking the work, they will provide a certificate or notice to confirm that the installation is tested & safe to use.

IT IS RECOMMENDED TO USE A QUALIFIED ELECTRICIAN

If there is any doubt whether electrical work needs notification of the Local Authority, they should be contacted first for advice.
